

Feedback Analysis Framework

Purpose: make the route from feedback to a product decision explicit and reviewable.

Author: Jalpa Parmar

Version 1.0 | 23 September 2026

Independent portfolio prototype. All reviews, versions and analysis scenarios are fictional.

Reviews are a product signal, not the final decision.

An opportunity may be framed before validation, but it remains provisional. Validation comes before committing to a solution or delivery priority.

Principles I would apply

Principle	What I would check
Reviews are one signal.	Combine review patterns with support evidence, task observation and product telemetry.
Frequency is not impact.	A rare access or payment barrier may matter more than a common cosmetic request.
Low ratings need context.	Read the review. Stars may reflect expectations, a one-off failure or several mixed issues.
Version correlation needs validation.	Check release changes and sample composition; do not infer cause from timing alone.
Feature requests describe needs.	Ask what the person is trying to accomplish before adopting the proposed feature.
Combine qualitative and quantitative evidence.	Use comments to understand the problem and behavioral data to estimate reach and severity.

A small, repeatable review

Check sample coverage and duplicates. Assign one primary theme consistently while preserving the original text. Compare counts and sample sizes across platform, version and time. Write the observation separately from the interpretation, then state what evidence would change the recommendation.

Prioritization boundary

The score in the matrix structures discussion using explicit assumptions. It does not set company priorities or replace accessibility, safety and business judgment. I would revisit assumptions when validation produces new evidence.

Limits of this portfolio exercise

The 180 reviews are fictional. Labels and patterns are constructed. There are no external APIs, live customers, model predictions or production results. The static dashboard shows an approach to product analysis, not a validated market finding.
