

UAT / Validation Plan

Purpose: prepare a repeatable review with support and engineering users before considering integrations or production AI.

Author: Jalpa Parmar

Version 1.0 | 23 September 2026

Independent portfolio prototype. Synthetic scenario; no employer or customer data.

Status: planned stakeholder validation; all scenarios below are Not run. These are synthetic prototype scenarios, not a production UAT record. Technical regression checks performed during portfolio maintenance do not constitute user acceptance.

How I would run the session

Start from Reset demo. Use fictional text only. For each scenario, record the observed result, Pass / Fail / Blocked, reviewer and date. Reset between independent scenarios. For scenarios 09-11, use the same approved item so status and digest behavior can be traced.

Entry: accessible demo, agreed synthetic examples and a reviewer for the modeled role. Exit: review every scenario, resolve or explicitly accept blocking issues, and record stakeholder feedback. No acceptance sign-off has occurred.

Validation scenarios

UAT-01 High-impact payment request

Action: Open SUP-101 and inspect its analysis.

Expected: Payments is identified; High priority is suggested; original context and validation ideas are visible. No work is created.

Status: Not run **Observed result:** _____

UAT-02 Authentication request

Action: Open a synthetic Authentication request.

Expected: High priority is suggested with authentication-related context and validation ideas.

Status: Not run **Observed result:** _____

UAT-03 Low-priority reporting issue

Action: Open a synthetic Reporting request.

Expected: Low priority is suggested and remains subject to reviewer judgment.

Status: Not run **Observed result:** _____

UAT-04 Priority override

Action: Change suggested priority before approval.

Expected: Approved work uses the selected priority; the feedback view records the override.

Status: Not run **Observed result:** _____

Reviewer: _____ Date: _____ Notes: _____

Validation scenarios (continued)

UAT-05 Routing override

Action: Change queue and engineer before approval.

Expected: Approved work uses the chosen queue and owner; feedback records the routing change.

Status: Not run **Observed result:** _____

UAT-06 Summary edit

Action: Edit the suggested summary and approve.

Expected: Work contains the edited summary; original request remains intact; feedback records the edit.

Status: Not run **Observed result:** _____

UAT-07 Return for information

Action: Try return with a blank note; then add a fictional information request.

Expected: Blank note is rejected. With a note, status becomes Awaiting Information and no work is created.

Status: Not run **Observed result:** _____

UAT-08 Create engineering work once

Action: Approve a request, then revisit it and attempt another approval.

Expected: Only one linked engineering item exists; repeated approval cannot create a duplicate.

Status: Not run **Observed result:** _____

UAT-09 Engineering status update

Action: Change approved work from Ready to In Progress, then Blocked.

Expected: The board reflects each selected state and records the session change.

Status: Not run **Observed result:** _____

Reviewer: _____ Date: _____ Notes: _____

Validation scenarios (continued)

UAT-10 Support status sync

Action: Set work to Validation, then Resolved.

Expected: Support becomes In Validation, then Ready for customer confirmation. No automatic release or customer closure occurs.

Status: Not run **Observed result:** _____

UAT-11 Digest reflects current state

Action: Review morning/evening digests after changing work status.

Expected: Digest uses current session owners, priorities and blockers; resolved work is not listed as open.

Status: Not run **Observed result:** _____

UAT-12 Reset and session limits

Action: Cancel reset, then confirm it. Refresh after making another change.

Expected: Cancel preserves decisions. Confirm and refresh restore synthetic starting data; session changes do not persist.

Status: Not run **Observed result:** _____

UAT-13 Keyboard and small screen

Action: Navigate review controls by keyboard at desktop and mobile widths.

Expected: Labels and focus are clear; key decisions remain reachable without horizontal page overflow.

Status: Not run **Observed result:** _____

Reviewer: _____ Date: _____ Notes: _____
