

SmartServe | Product Requirements Document

Jalpa Parmar | Independent product concept

Problem and users

A fictional small service business receives appointment-change requests across scattered channels. A service coordinator needs to capture, assign and confirm each request; a customer needs a clear response. These are assumptions for a portfolio concept, not research findings.

Goals and non-goals

Goals: Make request ownership visible and confirm the outcome. **Non-goals:** Payments, automated scheduling, broad analytics and multi-business administration in the first MVP.

MVP requirements

ID	Requirement	Acceptance criterion
R1	Capture a change request	Customer can provide contact, appointment and requested change
R2	Coordinator queue	New requests appear with status and received time
R3	Assign owner	Coordinator can assign a request; owner remains visible
R4	Confirm outcome	Customer receives an explicit confirmation after review

User stories

As a coordinator, I want to see unassigned changes so I can respond and assign an owner. As a customer, I want to know whether my change was accepted so I can plan accordingly.

Success measures

I would measure request completion, time to first response, unassigned backlog, confirmation rate and reasons for abandonment. No outcome is claimed.

Dependencies and open questions

Dependencies: appointment reference, communication channel, access control and support workflow. Questions: Which channel do customers prefer? What requires manual confirmation? How are conflicting changes handled? Validate with real users before development.
